Commercial UPS Uninterruptible Power Supply

Overview

What is an uninterruptible power supply (UPS) system?

An Uninterruptible Power Supply (UPS) system is a device that provides reliable backup power to safeguard critical operations against power loss and other electrical disruptions. Our UPS solutions are built to provide a vital power bridge between mains failure and generator activation, no matter how complex or critical your operation.

What is the difference between a generator and a ups?

A generator provides standby power until the mains power can be reinstated during a power outage. This is supported by a UPS (Uninterruptible Power Supply) which ensures a seamless transition from your mains power to your backup power supply. Batteries provide power to your UPS and generator.

What does UPS commissioning involve?

How does an UPS system work?

When initiated the UPS will send a signal to the generator to start up. Once the generator is running, the UPS will switch to generator power. When the power outage is over and grid power is restored, the UPS will return to utility power and recharge its batteries. The generator will then shut down. How do UPS systems work?

Do you need a battery system to backup your ups power supply?

For mission critical applications, having a reliable battery system to backup your UPS power supply is essential to supporting your critical load during a power quality event.
