

EU household energy storage requirements

Overview

How does energy storage work in the EU?

The main energy storage method in the EU is by far 'pumped storage hydropower', which works by pumping water into reservoirs when there is an electricity surplus in the grid - for example on a sunny or windy day - and releasing it when more energy is needed.

How much energy storage will Europe have in 2024?

Many European energy storage markets are growing strongly, with 4.9 GW (12.1 GWh) of utility-scale (front-of-the-meter) energy storage deployed in 2024, giving an estimated total of more than 13 GW. Different studies have analysed the likely future paths for the deployment of energy storage in Europe.

What is the European Commission doing about energy storage?

The European Commission in 2020 published a study on energy storage, which summarized some previous studies and reports, explored current and potential energy storage markets in Europe, and set out policy and regulatory recommendations for energy storage.

What are EU energy storage initiatives?

EU energy storage initiatives are a key part of advancing energy security and the transition toward a carbon-neutral economy, improving energy efficiency, and integrating renewable energy sources into electricity systems, and can play an integral role in balancing power grids and saving surplus energy.
