

Energy consumption of battery cabinet air cooling and liquid cooling

Overview

What is the total energy consumption of a liquid cooling data center?

The total energy consumption includes the energy consumptions of the cabinets, uninterruptible power supply (UPS), cooling system, lighting system, power transfer, and distribution system. The PUE of the liquid cooling data centers can usually be reduced to below 1.3 [6, 7].

Is indirect liquid cooling a viable solution for cabinet power density reduction?

Indirect liquid cooling is currently the main cooling method for the cabinet power density of 20 to 50 kW per cabinet. An integrated energy storage batteries (ESB) and waste heat-driven cooling/power generation system was proposed in this study for energy saving and operating cost reduction.

How much energy is saved by 1000 cabinets?

Maximum energy saving reaches 90.8 GWh/year with 1000 cabinets. Maximum net present value reaches 998 million CNY. Huge energy consumption of data centers has become a concern with the demand for greater computing power. Indirect liquid cooling is currently the main cooling method for the cabinet power density of 20 to 50 kW per cabinet.

How much energy is saved by a cooling system?

Coupled waste heat recovery and energy storage subsystems were included. Refrigeration modes were clarified to save cooling energy. Power usage effectiveness is reduced from 1.317 to 0.981. Maximum energy saving reaches 90.8 GWh/year with 1000 cabinets. Maximum net present value reaches 998 million CNY.
