

# **Energy storage temperature regulation system**

## Overview

---

How much energy does a container storage temperature control system use?

The average daily energy consumption of the conventional air conditioning is 20.8 % in battery charging and discharging mode and 58.4 % in standby mode. The proposed container energy storage temperature control system has an average daily energy consumption of 30.1 % in battery charging and discharging mode and 39.8 % in standby mode. Fig. 10.

Do cooling and heating conditions affect energy storage temperature control systems?

An energy storage temperature control system is proposed. The effect of different cooling and heating conditions on the proposed system was investigated. An experimental rig was constructed and the results were compared to a conventional temperature control system.

What are the temperature control requirements for container energy storage batteries?

In view of the temperature control requirements for charging/discharging of container energy storage batteries, the outdoor temperature of 45 °C and the water inlet temperature of 18 °C were selected as the rated/standard operating condition points.

How much energy does a temperature control system use?

The average energy consumption of the proposed temperature control system accounts for about 3.5 % of the energy storage, in which the average energy consumption of charging mode and discharge mode accounts for 1.06 %, and the energy consumption of standby mode accounts for 1.41 %. Fig. 7.
