Download the LiFePO4 voltage chart here(right-click -> save image as). Manufacturers are required to ship the batteries at a 30% state of charge. This is to limit the stored energy during transportation. I.

Does iron phosphate increase capacity with charge voltage?

The results with iron phosphate batteries also show an increase in capacity with charge voltage. However, charging starts at a lower voltage than lithium ion, with some charging starting as low as 3V.

How many volts does a LiFePO4 battery charge?

LiFePO4 batteries have a charging voltage of 3.65 Volts per cell. PowerStream offers 1-cell to 8-Cell chargers for LiFePO4 packs. How much voltage does it take to charge a lithium-ion battery?

This passage is about chargers for LiFePO4 batteries and mentions the charging voltage.

How many volts does a lithium phosphate battery take?

A lithium iron phosphate battery doesn't require being fully charged, but around 3.3 volts is the magic number for significant charging. If all you have available is 3.3 volts and you don't mind the loss in capacity, you could use it for charging.

How many volts can a lithium battery charge?

A voltage range of 13.8-14.7 V safely charges either battery. Choose a charger that stays within these limits. Charge current depends on battery capacity: lithium can charge up to 1C, SLA below 0.3C (e.g., 10 AH lithium = 10 A, 10 AH SLA = 3 A). Cutoff current is 5% of capacity (0.5 A for both).
