High frequency inverter front stage module

Overview

What is a high frequency inverter?

In many applications, it is important for an inverter to be lightweight and of a relatively small size. This can be achieved by using a High-Frequency Inverter that involves an isolated DC-DC stage (Voltage Fed Push-Pull/Full Bridge) and the DC-AC section, which provides the AC output.

Which power supply topologies are suitable for a high frequency inverter?

The power supply topologies suitable for the High-Frequency Inverter includes push-pull, half-bridge and the full-bridge converter as the core operation occurs in both the quadrants, thereby, increasing the power handling capability to twice of that of the converters operating in single quadrant (forward and flyback converter).

What is a buckboost inverter?

The buck-boost inverter can convert the PV module's output voltage to a high-frequency square wave (HFSWV) and can enhance maximum power point tracking (MPPT) even under large PV voltage variations. The high-frequency transformer gives galvanic isolation for the system, which decreases the leakage current and improves the system power quality.

What is the first stage of a solar inverter?

The first stage, called the “BOOST” stage, is common to most solar inverters and power factor correction (PFC) converters. A converter used as a front-end between PV panels and inverter, amplifies the panel voltage into a DC BUS from 400 V to 500 V for 3 kW output power.
