## Overview

How long can a 24V inverter run?

Regardless of the size, the calculation steps are always the same. Using this calculation, a 24V inverter with a 100ah battery and 93% efficiency can run a 500W load for 2.3 hours. You have a 24V inverter with a 150ah deep cycle battery. The inverter is 93% efficient. You want to run a 700 watt load, so how long can the inverter run this?

How many Watts should a 24V inverter run?

Factor the inverter efficiency rating and the available capacity will be around 1000 watts. 1000 watts is enough to run your load for an hour. To run it in four hours, you need four x 100ah 24V batteries. If you prefer to use amps instead of watts, the formula is: Total amps drawn per hour x operating hours + 100% = battery size.

How do you calculate inverter usage time?

To calculate the usage time of an inverter, multiply the battery capacity by 12 (to convert Ah to Wh assuming a 12V battery), then multiply by the inverter efficiency, and finally divide by the load power. What is Inverter Usage Time?

Inverter usage time refers to the duration an inverter can supply power to a load before the battery is depleted.

How much power does a 12V inverter use?

For example: If you're running a 1500W inverter on your 12v battery with 1000 watts of total AC load. So your inverter will be consuming 83 amps (amps = watts/battery volts) from the battery for which you'll need a very thick cable. using a thin cable in this scenario can damage the inverter or you'll not be able to run your load.
