

# North-South orientation of solar panels on rooftops in Hanoi

## Overview

---

Which roof orientation is best for solar panels?

The ideal roof orientation for maximizing solar panel efficiency varies by hemisphere. In the Northern Hemisphere, solar panels achieve maximum efficiency when mounted on south-facing roofs. This orientation allows panels to capture the maximum amount of sunlight as the sun travels from east to west.

Should solar panels be mounted on a south-facing roof?

In the Northern Hemisphere, solar panels achieve maximum efficiency when mounted on south-facing roofs. This orientation allows panels to capture the maximum amount of sunlight as the sun travels from east to west. Determining the best orientation involves not just general guidelines but also a professional assessment of the specific site.

Which direction should a solar roof face?

The direction that a roof faces is crucial. In the Northern Hemisphere, a south-facing roof is ideal because it receives the most sunlight throughout the day. Conversely, in the Southern Hemisphere, a north-facing roof is preferable. The angle of the roof affects the intensity of solar radiation hitting the solar panels.

Should solar panels be mounted on a flat roof?

**Flat and Steep Roofs:** On flat roofs, solar panels should be mounted with a tilt to optimize angle to the sun, while steep roofs might require special installations to decrease the angle to improve solar capture. For roofs that do not have ideal conditions, several solutions can be implemented:
