

Structural design of energy storage and battery swap station

Overview

What are the components of the automatic battery swapping station?

The main components of the automatic battery swapping station are the battery pack storage device, the battery swapping platform, and the battery swapping station. The battery pack storage device is located underground. The cyclic battery pack storage device has two sets and is located on both sides of the swapping platform. The cyclic battery pack storage device can change the battery packs from the battery swapping position back to the storage position.

What is the design scheme of automatic battery swapping vehicles?

Design Scheme of Automatic Battery Swapping vehicles. During the battery swapping process, there is no need to lift the vehicle, which saves the high-power motor that would be necessary to do so. The design also controls the overall height of the swapping platform and station.

Is a battery swapping station a separate operation system?

It can be seen that the battery swapping station is not a separate operation system. Due to the operation of battery charging or discharging, the battery, the distribution network and the battery swapping station are all under centralized management and constitute an integrated system.

What is automatic battery swapping station?

The automatic battery swapping station mainly includes a cyclic battery pack storage device, a battery pack storage compartment, a swapping platform and so on. The cyclic battery pack storage device has a battery life processor, and the battery pack storage compartment reads the usage curve data of each battery through an interface.
