

# **The relationship between windmill power generation and energy storage**

## Overview

---

How can wind energy be stored?

Since wind conditions are not constant, wind energy can be stored by combining wind turbines with energy storage systems. These hybrid power plants allow for the efficient storage of excess wind power for later use.

Should wind turbines be combined with energy storage systems?

Combining wind turbines with energy storage systems is beneficial in several ways. One of the primary drivers is repowering, which involves dismantling old wind turbines and constructing new ones nearby. If regulatory constraints prevent new turbine installations at the same site, an energy storage system can be a viable alternative.

How is wind energy power generation and storage implemented?

In this paper, standalone operation of wind energy power generation and storage is discussed. The storage is implemented using supercapacitor, battery, dump load and synchronous condenser. The system is simulated for different power generation and storage capacity. The system is regulated to provide required voltage.

How a wind energy storage system works?

To meet the power demand, the wind generator operates to generate power. When the power demand can be met with the wind energy generation, energy storage system is not supplying power to the load. If the demand is more than the wind power generator, energy storage system is operated along with windmill.
