

# What are the capacities of solar inverters

## Overview

---

How big should a solar inverter be?

Getting the inverter size right depends on two key factors: Inverters work most efficiently when operating near their maximum capacity and are typically sized to be roughly the same size as your solar panels. Inverters are usually sized lower than the kilowatt peak (kWp) of the solar array because solar panels rarely achieve peak power.

Do you need a solar inverter?

The inverter is one of the most important components of a home or portable solar power system. Solar panels produce DC electricity, but you need an inverter to convert DC power into 120/220 volt AC electricity. Only after conversion can home appliances and other devices use it.

Why is the size of a solar inverter important?

The size of a solar inverter is crucial because it determines how much energy can flow to your home and battery at any given time. More specifically, the inverter ensures that enough energy can flow from your solar panels to the grid and load or if installed with a battery, from and to the battery.

Why are solar inverters sized lower than kilowatt peak?

Inverters are usually sized lower than the kilowatt peak (kWp) of the solar array because solar panels rarely achieve peak power. The solar array-to-inverter ratio is calculated by dividing the direct current (DC) capacity of the solar array by the inverter's maximum alternating current (AC) output.
