Overview

How does a solar inverter work?

Most homes and appliances run on alternating current (AC). This is where the solar inverter comes in. Put simply, a solar inverter converts the DC electricity generated by your solar panels into AC electricity that can be used in your household or fed back into the power grid. Without it, all that solar energy would be essentially unusable.

What is a solar power inverter?

A solar power inverter is a critical component of a solar panel system, as it allows the system to generate electricity. Solar panels, which are typically made from silicon and encased in a metal frame within glass, cannot generate electricity directly without an inverter.

How do solar panels connect to an inverter?

Solar Panels to Inverter: Your panels are wired together and connect to the DC input of your inverter. **Battery to Inverter (Hybrid Systems Only):** For hybrid systems, your battery bank also connects to the inverter's dedicated DC battery terminals.

How does a solar inverter connect to the grid?

During installation, a solar inverter connects to the grid by wiring the system. If the solar panels produce more power than the user requires, the excess power is transferred to the utility meter and then to the grid.
